1.1.2 Causality	5
<b>1.2 Economic Data</b>	6
1.2.1 Cross sectional data	6
Definition: To be an <b>independent</b> observation, it must be drawn without influence from another variable.	6
1.2.2 Time series Data	6
1.2.3 Pooled Cross Sections	7
1.2.4 Panel or longitudinal data	7
Topic 2: Simple regression model	7
<b>2.1 Zero Conditional Mean</b>	8
<b>2.2 Regression functions</b>	8
Population regression function	8
Sample regression function	9
<b>2.3 Estimators</b>	9
<b>2.4 Simple regression model statistics</b>	10
2.4.1 Sum of squares	10
2.4.2 Goodness of fit	11
<b>2.5 Functional forms</b>	11
<b>2.6 Assumptions of the simple linear regression model</b>	12
<b>2.7 Variance of OLS estimators</b>	13
Topic 3: Multiple regression model	14
<b>3.1 Assumptions of the multiple regression model</b>	14
<b>3.2 Irrelevant variables</b>	15
<b>3.3 Omitted variable bias</b>	15
Topic 4: Inference	16
<b>4.1 Classical linear model</b>	16
<b>4.2 Hypothesis tests</b>	16
4.2.1 t-tests	16
4.2.2 p-value	18

4.2.3 Confidence interval .....	18
4.2.4 Single Linear combinations (F-tests) .....	18
Topic 5: Multiple regression with qualitative information .....	21
<b>5.1 Single dummy independent variables</b> .....	21
<b>5.2 Comparison of means test</b> .....	21
<b>5.3 Dummy variables for multiple categories</b> .....	22
<b>5.4 Interaction effects</b> .....	22
Topic 6: Heteroskedasticity .....	23
<b>6.1 Consequences of Heteroskedasticity for ordinary least squares</b> .....	23
<b>6.3 Testing for Heteroskedasticity</b> .....	23
6.3.1 Breusch-pagan test for Heteroskedasticity .....	23
6.3.2 White test for heteroskedasticity .....	24
<b>6.4 Correcting for heteroskedasticity</b> .....	24
6.4.1 Feasible generalised least squares .....	24
6.4.2 Robust standard errors method .....	25
6.4.3 Weighted least squares .....	25
Topic 7: Specification issues .....	26
<b>7.1 Functional form misspecification</b> .....	26
<b>7.2 Testing for misspecification</b> .....	26
7.2.1 RESET test .....	26
7.2.2 Proxy variable .....	27
7.2.3 Used lagged dependent variables as proxy variables .....	27
<b>7.3 Measurement error</b> .....	27
7.3.1 Measurement error in the dependent variable .....	27
7.3.2 Measurement error in the explanatory variable .....	28
<b>7.4 Data problems</b> .....	28
7.4.1 Missing data .....	28
7.4.2 Non-random samples .....	28
7.4.3 Outliers .....	29

# Topic 1: The nature of Econometrics and Economic data

## 1.1 The nature of Econometrics

### 1.1.1 Introduction

Econometrics concerns the use of statistical methods in:

1. Estimating economic relationships
2. Testing economic theory
3. Evaluating government and business policy.

Empirical analyses generally consist of:

1. **An economic model** – which may be formally developed (e.g. derivation of consumer demand equations from a model of utility maximization) or based on intuitive reasoning
2. **An econometric model** – which requires specifying the nature of the relationship between variables.

Definition: A **variable** is a symbol that may assume any given value or set of values. Often in econometrics this can represent factors such as age, height, gender etc...

### 1.1.2 Causality

In most tests of economic theory and certainly for evaluating public policy, the economist's goal is to infer that one variable has a casual effect on another variable. Simply finding an association between two or more variables might be suggestive but unless causality can be established it is rarely compelling.

*Ceteris Paribus* is a Latin phrase which literally means "other relevant factors being equal". Predictions in econometrics must be *ceteris paribus* in order to rule out the possibility that other factors could influence the observed relationship.

## 1.2 Economic Data

### 1.2.1 Cross sectional data

A cross sectional data set consists of a sample of individuals, households, firms or other units taken at a given point of time. In pure cross-sectional data we would ignore any minor timing differences in collecting the data.

An important feature of the data is that we can often assume they have been obtained by random sampling. Sometimes it is not appropriate to assume random sampling, such as when people do not disclose the right information; it would not be a random sample.

Definition: A **random sample** is which a sample is collected from a population in such a way that every possible sample that could be selected has a predetermined probability of being selected.

There is also a violation of random sampling when the sample is large relative to the population as the population would not be large enough to assume the observations are independent draws.

Definition: An **observation** is a piece of data taken from a particular unit, time or place in a sample

Definition: To be an **independent** observation, it must be drawn without influence from another variable.

### 1.2.2 Time series Data

A time series data set consists of observations on a variable or several variables over time e.g., stock prices, money supply, GDP. Because past events can influence events and lags in behaviour are prevalent in the social sciences, time is an important dimension in a time series data set. Order conveys important information in a time series data set.

They are difficult to analyse because they can rarely be assumed to be independent across time, another feature that requires special attention is the data frequency at which the data is collected, which will show seasonal trends.

### 1.2.3 Pooled Cross Sections

Have both cross-sectional and time series features. It combines two sets of cross-sectional data. It increases the sample size by combining the two years and is an effective way of analysing the effects of a new government policy.

The order which we store the data is not important, but keeping track of the year is very important. In addition of increasing the sample size, the point of a pooled cross-sectional analysis is often to see how a key relationship has changed over time

### 1.2.4 Panel or longitudinal data

A panel data set consists of a time series for each cross-sectional member in the data set. The key feature of panel data that distinguishes them from a pooled cross section is the fact that the same cross-sectional units are followed over a given time period. The ordering in the cross section of a panel data set does not matter.

Panel data allows us to control certain unobserved characteristics, and secondly it also allows us to study the behaviour or the result of decision making.
